Outdated Accounting System? Key Items to Look for!

Is your accounting system outdated, costing you time, and more importantly money?

Are you unsure if it is time to upgrade your accounting software? Here are some key items to look for:

- Spending more time doing simple accounting tasks than you do running your business?
  - Working extra hours either at night or on weekends just to keep up
  - Data entry is where you are spending the majority of your time
  - Spending hours on month-end processing, manually mailing Invoices and Statements
  - Using spreadsheets to keep track of where you are spending and earning rather than getting up-to-date numbers from your system
- Your systems End-of-Life is coming soon, or has already passed, and is no longer being updated:
  - Developer no longer supporting your system
  - No updates to stop hacker attacks
  - Unable to transfer system to newer hardware or operating system
  - No update for tax and other tables
- System is not customizable:
  - Your accounting software is a one-size-fits-all
  - As your business changes, your accounting software should be able to change as well
  - Data fields, processes, reports, and other functions should be customizable to your business
- No or little integration to apps:
  - No support for importing information from 3rd party apps, causing duplicate entry
  - Double entry causing mistakes manually keying in information
  - Front-end processes allowing customers to view information about their account and history

The question now is, when will you upgrade your Accounting System?
